Website Review – Contemporary Group Limited

When I first opened the website, the very first thing I tried to understand was simple: *what exactly does this company do, and how quickly can I understand it?*

And that's where I immediately noticed a gap.

The website looks decent at a glance, the imagery is relevant, the branding is consistent, but as I interacted with it, I realized that clarity is missing. It feels more like a digital presence than a structured product. And for a company operating in a space as competitive and trust-driven as construction, architectural, and engineering, that difference matters a lot.

My First Observation: Structure Before Design

One of the first things I tried to do was explore their services. Naturally, I clicked on "View Our Services" expecting a breakdown of what they offer, civil engineering, infrastructure, project management, things like that.

Instead, it redirected me to the About page, and this is a **business communication issue**.

If I were restructuring this, the first thing I would do is introduce a **dedicated Services architecture**. Not just a page, but a system. Each service would have its own section, its own explanation, and ideally, real projects tied to it.

Because from experience, especially in industries like construction and architecture, people don't just want to *see that you exist*, they want to quickly understand:

- What you do
- If you've done it before
- And if you can do it for them

Right now, that clarity is missing.

And interestingly, this aligns with what's generally expected of construction/architectural company websites: clear service pages, structured navigation, and direct paths to action are considered essential for converting visitors into clients.

The Hero Section – Strong Visual, Weak Communication

The hero section is visually strong, no doubt. The imagery gives a sense of scale and professionalism.

But the content doesn't carry that same weight.

The text:

> "Committed to Excellence and Integrity in World Class Building Solutions"

It is safe… but too generic.

If I'm being honest, I could put that same sentence on five different construction company websites, and it would still fit.

What I would do differently is make the hero section **project-driven and contextual**.

Right now, the carousel rotates images, but they don't tell a story. I don't know:

- What project am I looking at
- Who it was built for
- When it was completed

So what I would do is make the carousel **dynamic and meaningful**:

- Each slide becomes a real project
- Each project has a title, location, and context
- The text changes with each slide

That way, instead of just "looking good," the hero section starts building credibility immediately.

Navigation & Flow – Where Users Get Lost

As I moved through the website, I noticed that the navigation doesn't guide me; it just lists pages.

There's a difference.

A well-structured website should feel like a guided experience:

- Homepage → Services → Projects → Contact

But here, the journey feels disconnected.

Even the Contact page, which should be one of the most important conversion points, doesn't feel like a place where action happens.

If I were improving this, I would redesign the Contact page completely:

- Add a proper form
- Add clear call-to-action messaging
- Make it feel like the start of a business conversation

Because right now, it feels passive.

Visual Design – Where the Brand Starts Losing Strength

This is where I became more critical.

The website doesn't look bad, but it *feels outdated*.

The spacing is inconsistent, the typography hierarchy isn't strong, and some UI elements (like icons and cards) feel like they belong to an older design system.

The blog section especially stood out:

- Uneven image sizes
- Poor alignment
- No visual rhythm

These things might seem small, but they affect perception. And in this industry, perception is everything.

Because before anyone calls you, your website has already answered the question:

> "Do these people look like they know what they're doing?"

Projects Section – Their Strongest Asset, Underused

This part actually got me excited, because I could see the potential.

They clearly have projects. Real ones. Valuable ones.

But the way they are presented doesn't reflect that value.

Right now:

- You mostly see images
- Details are hidden on hover
- There's no story

If I were handling this, I would turn the projects into **case studies**.

Not just:
"Here's what we built."

But:

- What was the challenge?
- What solution did we provide?
- What was the outcome?

Because that's what builds trust.

SEO – The Silent Problem

This is one of the biggest gaps, and it's not visible unless you think like a product or growth person.

If I search for:

- "Construction company in Lagos"
- "Engineering firm Nigeria"
- "Architectural companies in Nigeria."

Contemporary Group Limited doesn't show up prominently.

That's a problem.

Because a website like this should not just exist, it should **bring in business**.

From what I've seen, the issues likely come from:

- No dedicated service pages
- Weak keyword targeting
- Limited structured content

And again, this aligns with common challenges many construction/architecture companies face online: poor SEO structure, unclear messaging, and a lack of optimized service content.

If I were working on this, I would approach SEO as a system:

- Each service = a search opportunity
- Each project = a content opportunity
- Each blog post = a ranking opportunity

Competitor Perspective – Where the Gap Becomes Clear

When I step outside this website and look at the broader industry, the difference becomes more obvious.

Companies like:

- Julius Berger Nigeria Plc
- Cappa and D'Alberto Plc
- The Building Practice Ltd
- Studio Contra ~ https://www.studio-contra.com/
- Cleec Desing Studio ~ https://cleecdesigns.com/
- Ebisike Tochukwu Architects ~ https://ebisiketarchitects.com/
- Urban & Contemporary Architects Ltd ~ https://www.uca.ng/
- Delano Architects ~ https://delanoarchitects.com/
- TOSIN OSHINOWO ~ https://www.oshinowostudio.com/
- ATO Architects Limited ~ https://www.atoarchitects.com/

operate at a level where:

- Their services are clearly defined
- Their projects are showcased with authority
- Their positioning is unmistakable

These companies are known for handling large-scale infrastructure, civil engineering, and architectural projects across Nigeria.

So when someone compares websites, even subconsciously, they're not just comparing design, they're comparing **confidence, clarity, and credibility**.

And that's where Contemporary Group still has room to grow.
